CPEOJT (ON THE JOB TRAINING)

Name of Trainee: Jean Rose S. Jamelano Date: April 1, 2026
Host Training Establishment: One Negros Ads Hours Rendered: 8
Name of Supervisor: Diomeilyn J. Lingco Duration: 08:30 AM – 05:30 PM

OUTLINE OF TASKS:

1. TROUBLESHOOTING UNITS (TOY ROBOTICS)

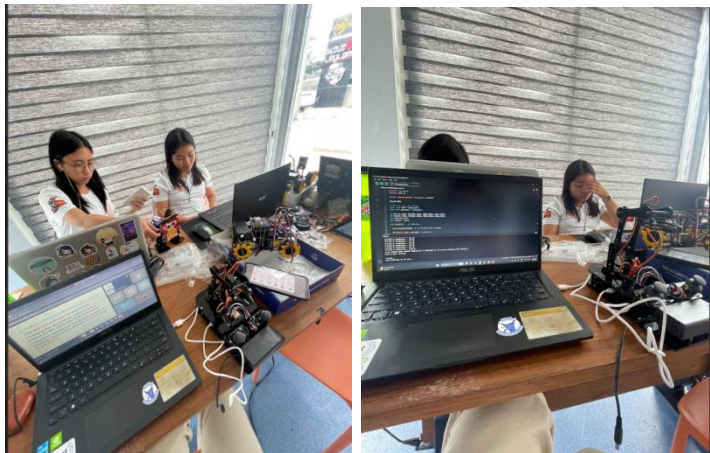

Competency Outcomes:

Competency:

ACCOMPLISHMENT REPORT FOR TASKS:

Today’s competency was troubleshooting toy robotics units. We began by assessing a new batch of ten robots that had been returned due to various performance issues. Several robots exhibited intermittent failures they would work briefly then stop. We disassembled these units to inspect internal wiring and solder joints. One robot had a cracked power wire or issues causing an inconsistent connection. Another unit’s motor would spin but not turn the wheels due to a stripped gear in the gearbox. We replaced the gear using a donor part and re-soldered three loose connections on different circuit boards. For more complex issues, such as a non-responsive microcontroller, we documented the symptoms and set the unit aside for supervisor review. By the end of the day, we had successfully restored full functionality to six robots and provided detailed failure reports for the remaining four. This troubleshooting session reinforced my ability to think critically and methodically, isolating problems from the most likely to the least likely causes.

OUTLINE OF TASKS:

- 1. MAKING POWERPOINT PRESENTATION
(FOR WORKSHOP)

Competency Outcomes:

Competency:

ACCOMPLISHMENT REPORT FOR TASKS:

Our competency for today was making a PowerPoint presentation for an upcoming workshop. The workshop aimed to teach basic robotics troubleshooting to a group of new trainees. Our supervisor provided us with a rough outline and several photographs of common failure points in our toy robots. We started by creating a title slide and an agenda to set expectations. Next, we organized the content into logical sections: common tools needed, safety precautions, step-by-step diagnostic flow, and examples of frequently encountered issues like bad solder joints, worn gears, and faulty battery contacts. For each issue, we inserted clear images with arrows and labels to highlight the problem areas. We also added a troubleshooting flowchart to help new trainees decide what to check first. To make the presentation engaging, We used minimal text per slide and incorporated simple animations to reveal steps one at a time. After completing the draft, we reviewed it with my supervisor, who suggested adding a slide on proper multimeter usage. By the end of the day, we had a polished, informative slide presentation ready for the workshop.

OUTLINE OF TASKS:

1. TROUBLESHOOTING UNITS (TOY ROBOTICS)

Competency Outcomes:

Competency:

ACCOMPLISHMENT REPORT FOR TASKS:

Today’s competency was again troubleshooting toy robotics units. We focused on the four robots that had been flagged on April 1 for complex issues. Using advanced diagnostic techniques, we re-examined the unit with the suspected microcontroller failure. After testing voltage inputs and clock signals with an oscilloscope, we confirmed that the microcontroller was receiving power but not sending output signals. We successfully re-flashed the firmware using a programming interface, which restored basic functionality. For another robot with erratic sensor behavior, we discovered that dust had accumulated on the infrared emitter and receiver. The remaining two units had motor driver issues, while the other had a cold solder joint on the driver IC that I reflowed. By the end of the day, all four complex robots were fully functional. We ran each through a 30-minute stress test to ensure stability. This experience taught us advanced troubleshooting techniques and the value of persistence when facing difficult repairs. We also documented each repair process for future reference.

OUTLINE OF TASKS:

1. PREPARATION FOR WORKSHOP

Competency Outcomes:

Competency:

ACCOMPLISHMENT REPORT FOR TASKS:

Our competency for today was preparation for the upcoming workshop. With the PowerPoint already finalized, my tasks shifted to logistical and hands-on preparation. We began by gathering all the materials needed for the workshop: ten non-functional toy robots for hands-on practice, multimeters, soldering irons, screwdrivers, replacement parts (gears, wires, batteries), and safety equipment like goggles and fume extractors. We tested each piece of equipment to ensure everything was in working order. Then set up the training room, arranging workstations for up to eight participants. Each station received a robot, a set of tools, and a printed copy of the troubleshooting flowchart we had created. We also prepared a “trainer’s kit” with extra parts and a fully functional robot for demonstration purposes. After setting up, we ran through the workshop agenda as if we were a participant, timing each activity and noting any potential bottlenecks. We realized that the soldering station might cause congestion, so we added an extra station. By the end of the day, everything was organized, labeled, and ready. This preparation taught me the importance of thorough planning and attention to detail when facilitating a training event.

OUTLINE OF TASKS:

2. PREPARATION FOR WORKSHOP (CONTINUATION)

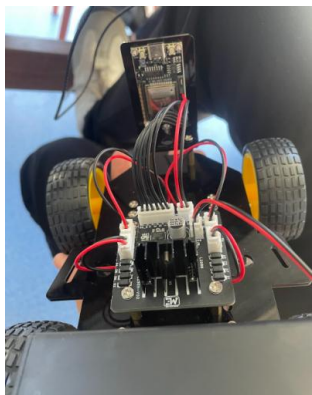

Competency Outcomes:

Competency:

ACCOMPLISHMENT REPORT FOR TASKS:

Our competency was a continuation of preparation for the workshop. Since the workshop was only one day away, we used this time to double-check every aspect of the event. We re-inspected all ten practice robots to ensure they had consistent, reproducible faults that participants could diagnose for example, one robot had a deliberately loose wire, another had a dead motor, and a third had a reversed battery connector. We created an answer key for myself, noting the exact fault in each robot and the correct repair procedure. We also prepared evaluation forms for participants to fill out after the workshop. We tested the projector, laptop, and speakers with the PowerPoint presentation, ensuring all images and animations displayed correctly. . To make the workshop more engaging, we printed stickers. Finally, we organized a brief dry run with a coworker, who acted as a participant and gave me feedback on my clarity and pacing. By the end of the day, we felt fully confident that the workshop would run smoothly. This experience taught me that successful training requires meticulous behind- the- scenes work.

OUTLINE OF TASKS:

1. WORKSHOP DAY

Competency Outcomes:

Competency:

ACCOMPLISHMENT REPORT FOR TASKS:

Today was the workshop day. Our competency was to facilitate the hands-on troubleshooting session for new trainees. We arrived early to set up the room, ensuring all workstations had the necessary tools and robots. The workshop began with a minute presentation using the slides we had prepared, covering safety, tools, and diagnostic flow. Then, participants moved to their workstations. Our role was to guide them through troubleshooting their assigned robots without giving away the answers immediately. We encouraged them to follow the flowchart, starting with power checks before moving to internal components. As they worked, we circulated to answer questions, demonstrate proper soldering technique, and help those who were stuck. Most participants successfully identified the deliberate faults within the allotted time. One participant struggled with a particularly well-hidden loose wire, so we walked them through the process of tracing continuity. By the end of the session, the toy robot were repaired, and participants expressed confidence in their new skills. We collected the evaluation forms, which were overwhelmingly positive. This workshop day was the culmination of weeks of preparation and gave me immense satisfaction in seeing others learn from my work.
